Heating and hot water

The heating and hot water are controlled via a smart boiler (newly installed in 2020). There should be constant hot water but if you experience problems please contact the owner or housekeepers (contact details will have been supplied).

The heating temperature is also controlled remotely but you can alter it during your stay to suit your needs by using the thermostat controller in the sitting room. Turn the controller clockwise to increase the temperature (you will see the target temperature displayed on the controller). Turn anti-clockwise to lower the temperature.

The heating will default to 15°C at 10pm for overnight and return to 18°C at 6am each day. If you change the temperature, your new setting will remain operative until the next scheduled default setting.
